Introduction

Luminescence and
mechanoluminescence

Material formulation

Introduction

Luminescence

Luminescence:

- **Light emission** resulting from an **excitation**

Various types of **luminescence** depending on the **excitation source**:

- **Electroluminescence** (electric field)
- **Cathodoluminescence** (electronic bombardment)
- **Photoluminescence** (electromagnetic radiation)

Introduction

Introduction

Luminescence

- Focus on **photoluminescence** induced by a **luminescent center (Eu²⁺)**

Step 1: UV irradiation

- **Eu²⁺ electronic configuration change:**
 $4f^7 \rightarrow 4f^6 5d^1$
- **5d¹ electron escapes** to the **conduction band** (leaving a **hole** behind)
- Then **falls** in the **E₁ energy level (= trap)** **associated** to **defects** in the **crystal structure**

Step 2: Light emission

- With **time**, the **electron returns** to the **4f⁷ ground state** along **with light emission**:
- **Deeper energy levels: lifetime** ↗

Introduction

$$I(t) = I_0 \exp \left[-ste^{-\frac{E}{k_B T}} \right]$$

Mechanism

Mechanoluminescence

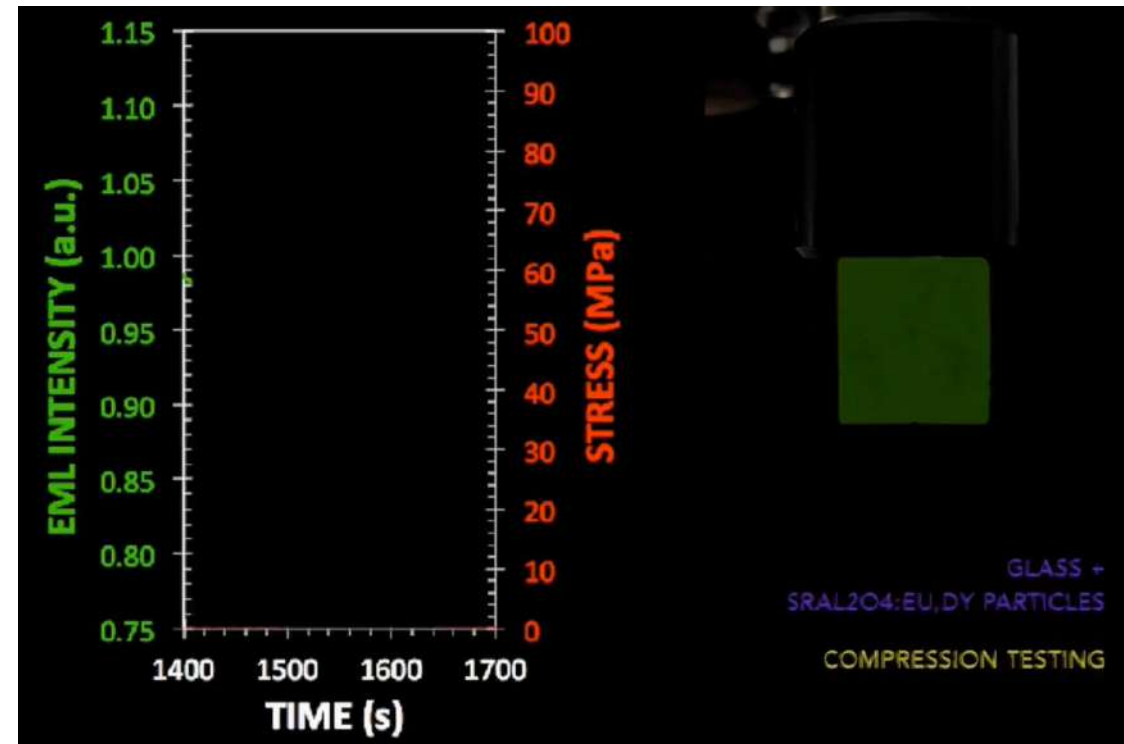

Introduction

Mechanoluminescence:

- Emission of light of a crystalline material as a response to a mechanical stimuli
- Focus on elasto-mechanoluminescence (elastic deformation)
- Changes the position of the energy levels, *i.e.* charge carriers recombination kinetics

This PhD is in line with the PhD of M. Dubernet, realized at the Glass Mechanics lab in 2016:

- It focused on a glass/particles composite ($\text{SrAl}_2\text{O}_4:\text{Eu}^{2+}, \text{Dy}^{3+}$)

Introduction

<https://www.youtube.com/watch?v=TGTBq8M4JRg>

Mechanoluminescent material formulation...

To **study mechanical phenomena** (crack propagation, etc.) **through a light emission**:

- Need a **bulk** and **crystalline material**
- Start from a **glass**

To achieve **mechanoluminescence** in a **bulk glass-ceramic**, we looked for:

- a **mechanoluminescent crystalline phase**
- that **can form a glass**
- with a **composition close to** that of the **glass** so as to **favor a congruent crystallization**

...to investigate mechanical phenomena

Oxynitride glasses:

Mechano-luminescence properties

However, Ba₄Si₆O₁₆:Eu²⁺:

- (very) small mechanoluminescence intensity
- Too small to properly analyze the signal

While the (mechano-)luminescence properties of several crystals are known:

- SrAl₂O₄:Eu²⁺, Dy³⁺
- ZnS:Cu⁺
- BaSi₂O₂N₂:Eu²⁺

Those of Ba₄Si₆O₁₆:Eu²⁺, RE (RE = rare earth) were **not** (or scarcely) reported

- Study of the (mechano-)luminescence properties with compositional changes
- Incidence of RE

Composition dependence

Mechanisms

Composition-dependent

(Mechano-)luminescence

Study of the **luminescence** and **mechanoluminescence** properties of $\text{Ba}_4\text{Si}_6\text{O}_{16}:\text{Eu}^{2+}$, *RE* powdered **crystals** with **compositional changes**:

- **Rare-earths co-doping**
- ***RE*:Eu²⁺ ratio** and **quantity**
- **Coupling thermally stimulated luminescence** and **mechanoluminescence** experiments

Composition-dependent

Thermally stimulated luminescence

Insights of the **energy levels depths** E and **concentrations** n_0 from **thermally stimulated luminescence**:

$$I(T) = sn_0 \exp\left(-\frac{E}{k_B T}\right) \left[\left(\frac{(l-1)s}{\beta}\right) \times \int_{T_0}^T \exp\left(-\frac{E}{k_B T}\right) dT + 1 \right]^{\frac{l}{l-1}}$$

- 1st step: **UV irradiation**
- 2nd step: after a few s, **heating** of the **sample** ($1 \text{ K} \cdot \text{s}^{-1}$)

Presence of ≥ 1 **peak**:

- T_{max} \nearrow : **deeper trap** ($E \nearrow$)
- **Intensity** \nearrow : $n_0 \nearrow$

Composition-dependent

powdered (crystals)

Composition-dependent

Mechanoluminescence

Mechanoluminescence measurement: Diametral compression tests on powder/epoxy composites

Mechanoluminescence behavior independent from RE co-doping

- **Mechanoluminescence** intensity \nearrow during **loading**
- **Mechanoluminescence** intensity \searrow during **unloading**

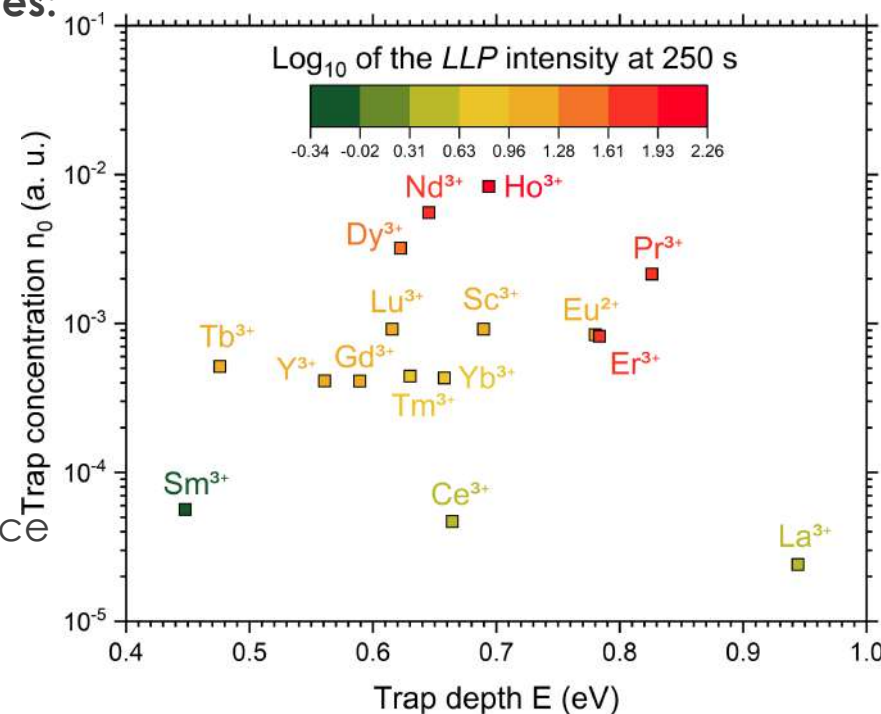

Composition-dependent luminescence and mechanoluminescence powdered (crystals)

Composition-dependent

(Mechano-)luminescence

Study of the luminescence and mechanoluminescence properties of $\text{Ba}_4\text{Si}_6\text{O}_{16}:\text{Eu}^{2+}$, RE powdered crystals with compositional changes:

- Rare-earths co-doping
- RE:Eu²⁺ ratio and quantity
- Coupling thermally stimulated luminescence and mechanoluminescence experiments
- The (mechano-)luminescence intensity changes by several orders of magnitude depending on the RE co-doping
- Rare-earths dependent local structural rearrangements induce changes in concentrations and trap depths of energy level
- Largest luminescence and mechanoluminescence intensity: $\text{Ba}_{3.5}\text{Eu}_{0.3}\text{Ho}_{0.2}\text{Si}_6\text{O}_{16.1}$ (20 % as intense as $\text{SrAl}_2\text{O}_4:\text{Eu}^{2+}$, Dy³⁺)

Composition-dependent luminescence and mechanoluminescence powdered (crystals)

Composition-dependent

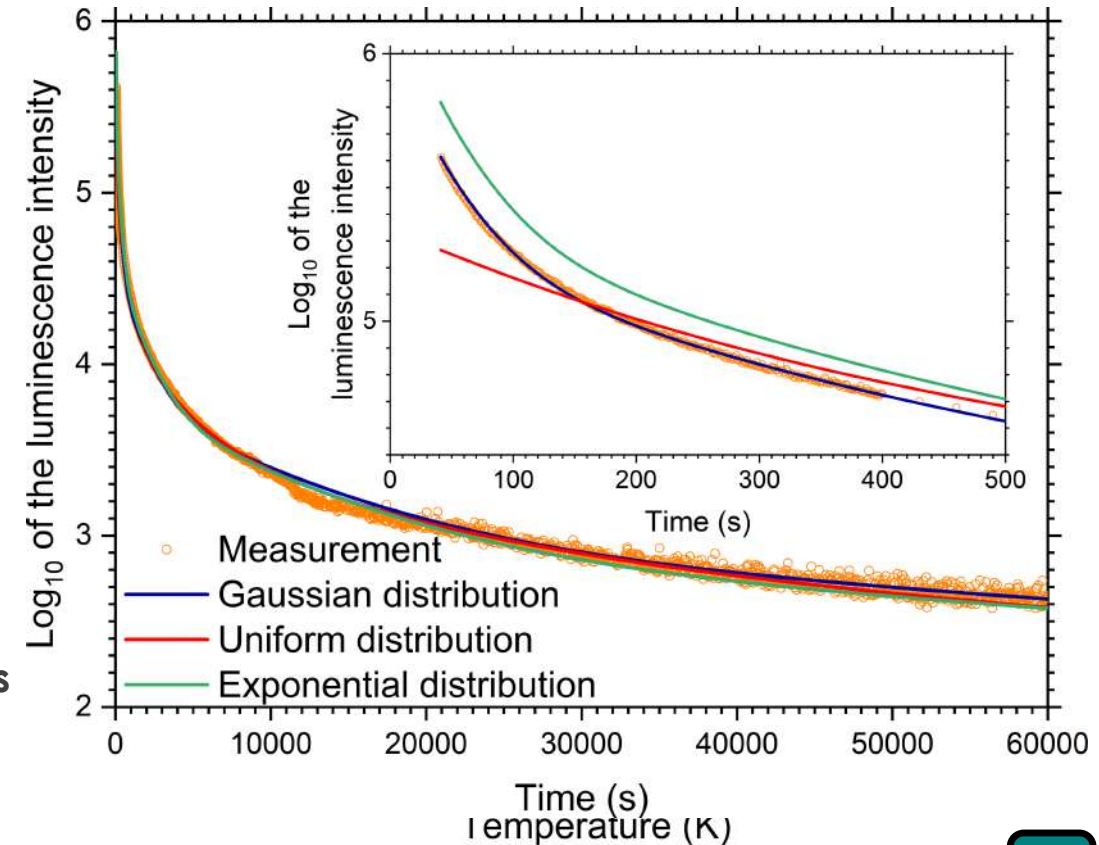

Thermally stimulated luminescence

Two important things to build the mechanoluminescence mechanism:

- **I.** The **luminescence** and the **mechanoluminescence intensity** are **proportional**
- **Charge carriers involved with luminescence** are also **involved** with **mechanoluminescence**

With $RE = Ho^{3+}$:

- **II.** Gradual **shift** in **T** of the peak with \nearrow **delay** time
- There is **at least ≥ 2 energy levels**
- The **study** of the **luminescence decay** (up to 16 h) **suggests** a continuous **distribution** of **energy levels**

Composition-dependent
luminescence and
mechanoluminescence
powdered (crystals)

Mechanisms

Luminescence

-----> Trapping
-----> De-trapping

-----> Trapping
-----> De-trapping

Composition-dependent
luminescence and
mechanoluminescence
powdered (crystals)

Mechanisms

Large trap distribution from ≥ 0.6 to ≥ 1.0 eV

It is believed that **mechanical stress** induces a **change** of the **trap depths**

Step 1: **mechanical stress** ↗

- The **trap depth** ↘

→ **Mechanoluminescence intensity** ↗

Step 2: **mechanical stress** ↘

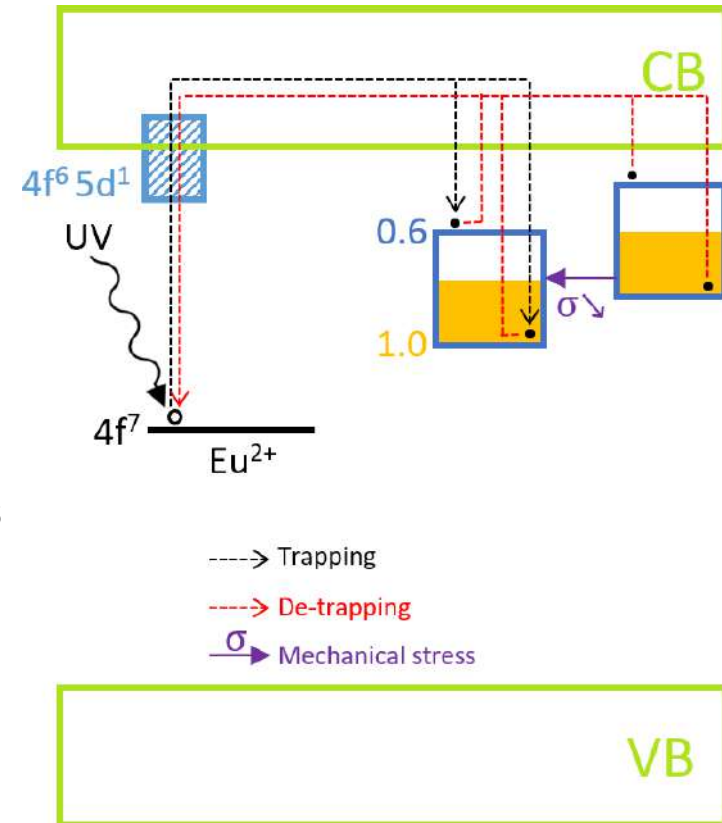

- The **trap depth returns** to its **initial state** but with ↘ **electrons**

→ **Mechanoluminescence intensity** ↘

Composition-dependent luminescence and mechanoluminescence powdered (crystals)

Mechanoluminescence

Mechanisms

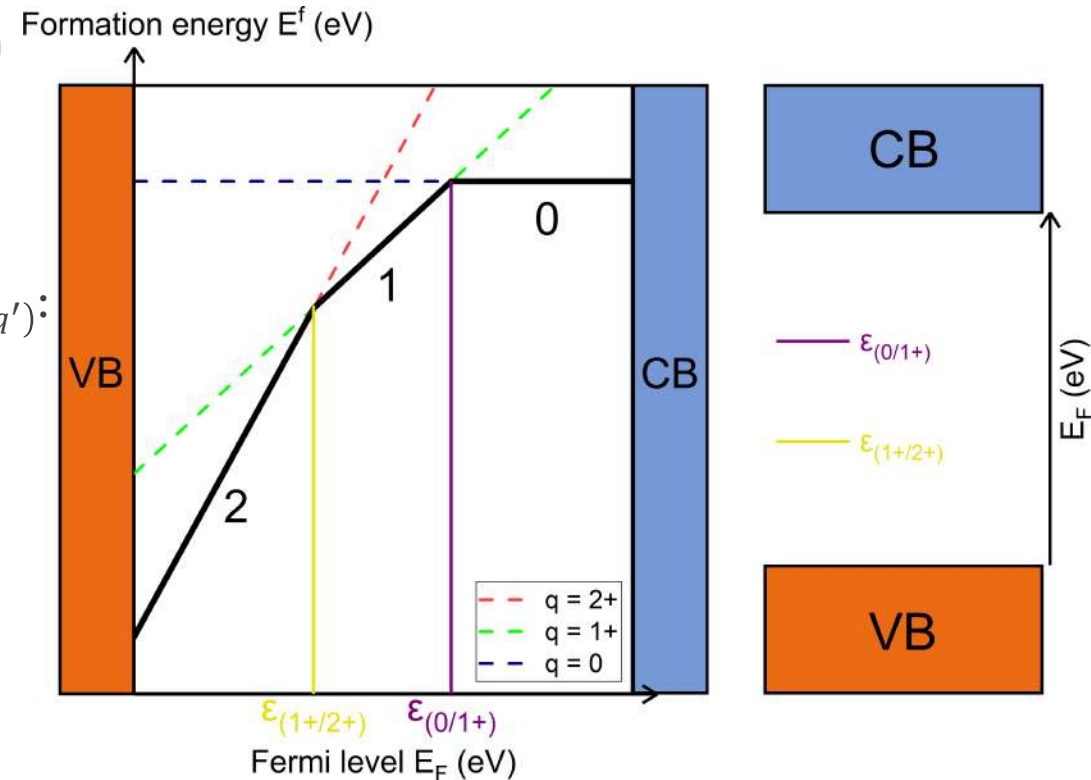

Nature of the point defects

DFT investigation:

- Calculate formation energy of various defects with different effective charges q
- Oxygen vacancy with 2 trapped electrons: $q = 0$
- Oxygen vacancy with 0 trapped electrons: $q = 2+$
- We calculate thermodynamic transition levels $\epsilon_{(q/q')}$:

$$\epsilon_{(q/q')} = \frac{E^f(D^q; E_F = 0) - E^f(D^{q'}; E_F = 0)}{q' - q}$$

→ Transition of an effective charge q to q'

Mechanisms

Review of several potential **point defects**:

- **Cationic** and **anionic vacancies**: Ba^{2+} , Si^{4+} , O^{2-}
- **Complex point defects**: **substitution**, **adjacent vacancies**

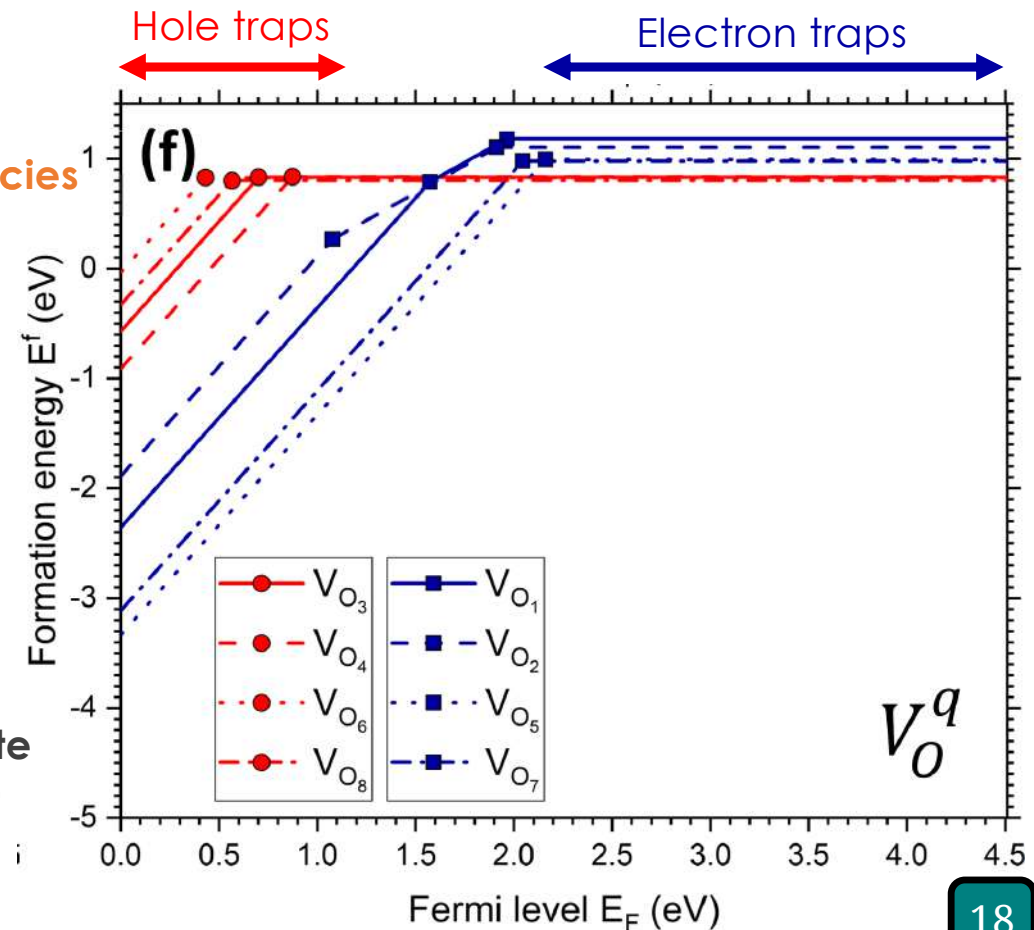

We discarded:

- **Large formation energies**
- **Too deep/shallow energy levels**

- **Oxygen vacancies act as hole traps**
- **Several energy levels distributed from 0.4 to 1.1 eV**
- This hole-trapping **mechanism for the $\text{Ba}_4\text{Si}_6\text{O}_{16}$ silicate** was **already observed in $\alpha\text{-SiO}_2$** (Si-Si bond breaking)

Elaboration

Stress-dependent
mechanoluminescence

Elaboration of the glass-ceramic

To obtain a bulk glass-ceramic:

→ Start from an oxynitride glass

Nitrogen has a strong incidence on:

- Mechanical, optical and electrical properties

Purpose of oxynitride glasses in this study:

- We need Eu^{2+} to observe mechanoluminescence
- But mostly Eu^{3+} in oxide glasses

Si_3N_4 is a reducing agent:

→ Control Eu^{2+} content through Si_3N_4 addition

Europium reduction rate

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

³Duval A, Houzot P, Rouxel T. Review: Elaboration, Structure, and Mechanical Properties of Oxynitride Glasses. J Am Ceram Soc. 2022;106(3):1611–1637. <https://doi.org/10.1111/jace.18824>

Elaboration of the glass-ceramic

To **quantify** both Eu^{2+} and Eu^{3+} :

→ **Mössbauer spectroscopy**

Si_3N_4 over-stoichiometry (~ 2.5 at. % N) to:

- Reduce **> 95 %** of Eu^{3+} into Eu^{2+}
- Free the melt of **N_2 bubbles**:

→ So as to **obtain homogeneous bulk specimens**

→ And finally **perform diverse mechanical testing** on these

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Europium reduction rate

Elaboration of the glass-ceramic

Melt-quench synthesis of the base glass

Synthesis of the **base glass**: 36.7 BaO – 57.6 SiO₂ – 1.7 Si₃N₄ – 3.0 EuO – 1.0 Ho₂O₃ (mol. %)

In a glove box:

- Controlled atmosphere (N₂)
- High temperature furnace (1800 °C)
- Annealing furnace
- Automated crucible uploader

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Synthesis of the base glass: 36.7 BaO – 57.6 SiO₂ – 1.7 Si₃N₄ – 3.0 EuO – 1.0 Ho₂O₃ (mol. %)

In a glove box:

- **Controlled atmosphere** (N₂)
- **High temperature furnace** (1800 °C)
- **Annealing furnace**
- **Automated crucible uploader**

→ ~ 40 g per batch

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Elaboration of the glass-ceramic

During oxynitride glasses synthesis:

- Si_3N_4 decomposes partly into $\text{Si} + \text{N}_2$
- Formation of Si and FeSi_x particles (10 nm – 10 μm)
- Homogeneously distributed

These act as crystallization points:

- A homogeneous and volumetric crystallization

Crystallization of the glass: 10 minutes at 1200 °C

- Congruent crystallization ($\text{Ba}_4\text{Si}_6\text{O}_{16}$)
- Large crystallization rate ($56 \pm 10 \%$)
- cm^3 large specimens, easy to shape
- Mechanical test on bulk specimens

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Stress-dependent mechanoluminescence

Introduction

- Investigation of mechanoluminescence through various mechanical tests

Hydrostatic stress: volume change

- Compressive stress (volume \searrow)
- Tensile stress (volume \nearrow)

Shear stress: shape change

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Stress-dependent mechanoluminescence

Isostatic pressure

Isostatic pressure test: **hydrostatic stress**

Gas introduced in a gas tank

- Control of stress σ
- Control of stress rate $\dot{\sigma}$

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Mechanoluminescence intensity: ~ 1000 a. u.

Stress-dependent mechanoluminescence

Uniaxial compression

Uniaxial compression test: **hydrostatic stress + shear stress**

- With similar σ and $\dot{\sigma}$ as **isostatic pressure** tests: **mechanoluminescence intensity \searrow (100 times !)**

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Mechanoluminescence intensity: ~ 10 a. u.

Stress-dependent mechanoluminescence

Torsion

Torsion test: **shear stress**

- Up to $\tau = 40 \text{ MPa}$ and $\dot{\tau} = 40 \text{ MPa} \cdot \text{s}^{-1}$
- No mechanoluminescence
(observed with $\sigma = 50 \text{ MPa}$ and $\dot{\sigma} = 5 \text{ MPa} \cdot \text{s}^{-1}$)

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

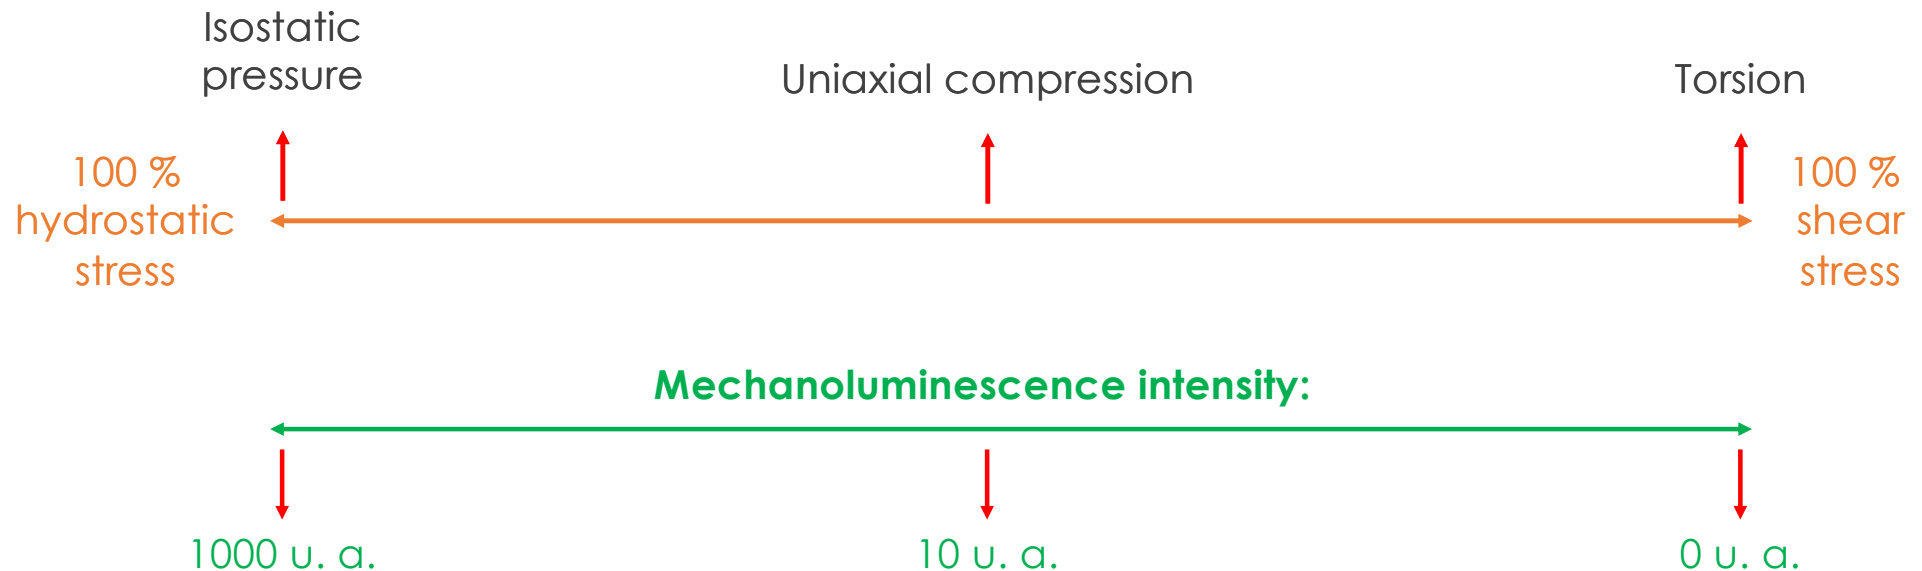

Mechanoluminescence intensity: 0 a. u.

Stress-dependent mechanoluminescence

Summary

Summary:

- **Identical mechanoluminescence behavior whatever the mechanical test**
- But **change** in **mechanoluminescence intensity**

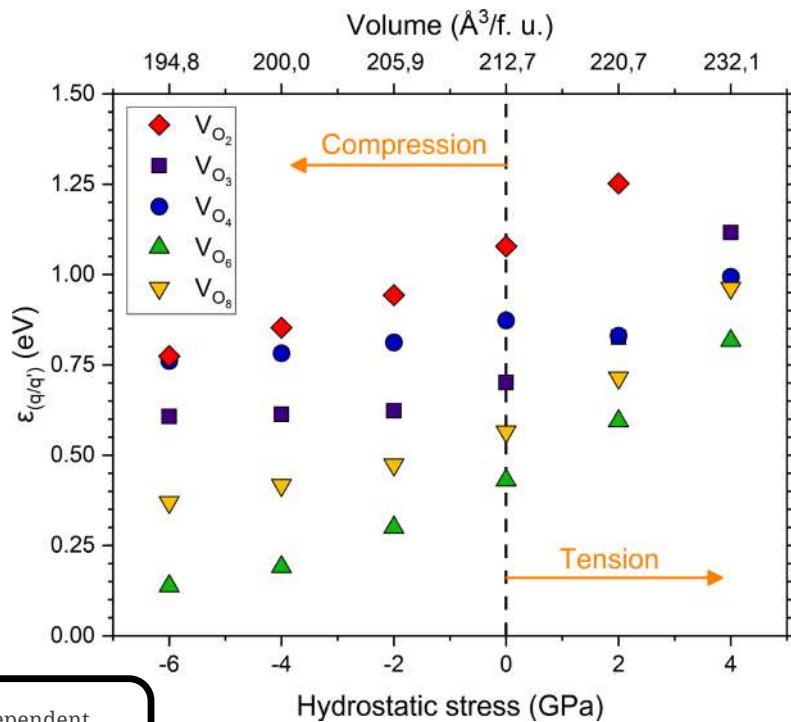

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Stress-dependent mechanoluminescence

Theoretical investigation

We considered the 5 identified energy levels (oxygen vacancies) and applied various stresses to $\text{Ba}_4\text{Si}_6\text{O}_{16}$:

- **Hydrostatic stresses** | The trap depth of every energy levels \searrow with \nearrow mechanical stress
- **Shear stresses** | Multiple trends: trap depth either \nearrow , \searrow , or remains unchanged. \searrow changes in compared to hydrostatic stress (with similar stresses)

Stress-dependent mechanoluminescence (bulk glass-ceramic)

→ Agreement with the experiment

Stress-dependent mechanoluminescence

Theoretical investigation

$\text{Ba}_4\text{Si}_6\text{O}_{16}$ is a 2D structure:

- Silicate chains in between BaO_8 sheets
- Point defects associated with luminescence: oxygen vacancies

(a, b) plane along b: gliding of silicate chains

- Slight changes of the oxygen environment
- Small changes in trap depth

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

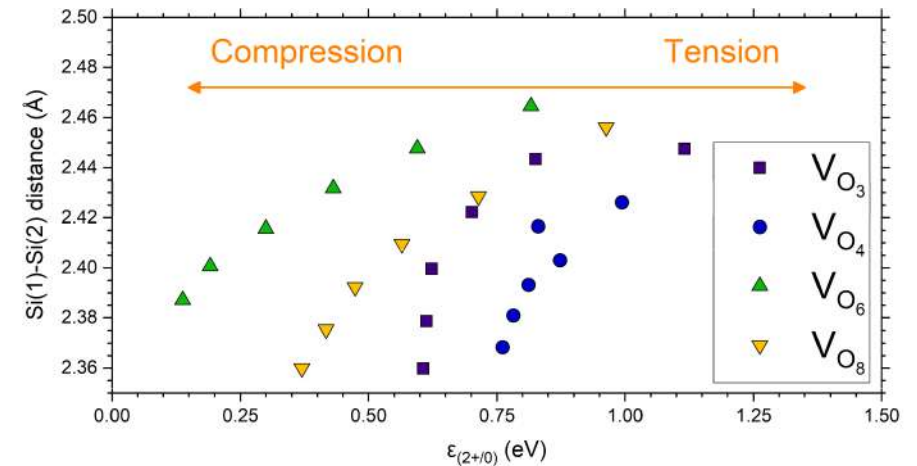

Stress-dependent mechanoluminescence

Theoretical investigation

Plot of Si-Si distance against the trap depth:

- **Mechanoluminescence** results from **changes** in the **trap depth** upon **mechanical loading**
- These **changes** stem from the **structural reorganization** of **point defects** as a **response** to the said **stress**
- **Si-Si distance** \searrow : **energy level depth** \searrow
- **Oxygen vacancies** are **more sensitive** to **hydrostatic stress** than **shear stress** (**even** for **similar Si-Si distances**)
- **Mechanoluminescence intensity** \nearrow when **hydrostatic stress** \nearrow

Stress-dependent mechanoluminescence (bulk glass-ceramic)

Introduction

Composition-dependent
luminescence and
mechanoluminescence
(powdered crystals)

Stress-dependent
mechanoluminescence
(bulk glass-ceramic)

Conclusions and
perspectives

Summary

Conclusions

Perspectives

Conclusions

Study of the composition-dependent luminescence and mechanoluminescence of $\text{Ba}_4\text{Si}_6\text{O}_{16}:\text{Eu}^{2+}$, RE:

- **Role of E and n_0**
- **Role of oxygen vacancies in the luminescence mechanism**

Elaboration of bulk mechanoluminescent glass-ceramics:

- **Control of the europium reduction rate**
- **Control of the crystallization rate**

Study of the stress-dependent mechanoluminescence of $\text{Ba}_4\text{Si}_6\text{O}_{16}:\text{Eu}^{2+}$, Ho^{3+} :

- **Experimental and theoretical study**
- **Separate role of hydrostatic stress and shear stress**

Proposition of a mechanoluminescence mechanism:

- **Changes in trap depth stem solely from the structural reorganization of the point defects as a response to the mechanical stress**

Conclusions

Applications:

- Stress sensing
- Energy storage
- Light sources responsive to mechanical stress

Study of mechanical phenomenon through light emission (crack propagation):

- No fracto-mechanoluminescence was observed
- The crack front avoids the crystals in the path
- Crystallization rate ↗
- Change to another mechanoluminescent crystal (start the study over again)

Conclusions and perspectives

Perspectives

Thank you !
